A. False, counterexample, 6 is even and 6 is divisible by 3.

vi. Part III Answer, if  $x$  is odd then  $x$  is divisible by 3

A. False, counterexample, 1 is odd and 1 is not divisible by 3.

2. Question 2

(a) Let  $f$  be a function from  $\mathbb{Z}$  to  $\mathbb{Z}$  defined by  $f(x) = 5 + 2x^2$ ,  $x \in \mathbb{Z}$ . Determine whether the function  $f$  is a bijective function. Justify your answer.

i.  $f(-1) = f(1)$ , BUT  $-1 \neq 1$ . Therefore,  $f$  is NOT a bijective function.

- (b) Let  $\rho = \begin{pmatrix} 1 & 2 & 3 & 4 & 5 & 6 \\ 4 & 6 & 2 & 5 & 1 & 3 \end{pmatrix}$  be a permutation of the set  $A = \{1, 2, 3, 4, 5, 6\}$ .

- i. Write  $\rho$  as a product of disjoint cycles.

$$\rho = (1, 4, 5) \circ (2, 6, 3)$$

- ii. Write  $\rho$  as a product of transpositions.

$$\rho = (1, 5) \circ (1, 4) \circ (2, 3) \circ (2, 6)$$

- iii. Determine whether  $\rho$  is even or odd.

A.  $\rho$  is even.

- (c) Use the Euclidean algorithm to find the greatest common divisor of 60 and 36. Write the greatest common divisor in the form of  $s60 + t36$ ,  $s, t \in \mathbb{Z}$ . Hence find the least common multiple of 60 and 36.

$$d = GCD(60, 36)$$

$$d = 60s + 36t$$

$$\ell = LCM(60, 36)$$

$$60 = 36(1) + 24$$

$$36 = 24(1) + 12$$

$$24 = 12(2) + 0$$

$$\begin{aligned} GCD(60, 36) &= GCD(12, 0) \\ &= 12 \end{aligned}$$

- i. LCM

$$d\ell = 60 * 36$$

$$\ell = \frac{60 * 36}{d}$$

$$= \frac{60 * 36}{12}$$

$$= 180$$

- (d)

- i. Let  $x = 2a, a \in \mathbb{Z}$

- ii. Then  $x + 3 = 2a + 3$

$$x + 3 = 2a + 3$$

$$= 2a + 2 + 1$$

$$= 2(a + 1) + 1$$

$$x + 3 = 2b + 1$$

$$b = a + 1 \in \mathbb{Z}$$

iii. Therefore,  $x + 3$  is odd.

ii. Find in-degree and out-degree

Vertex	a	b	c	d	e
In-degree	2	2	2	2	3
Out-degree	3	3	2	2	1

iii.
